PROPOSAL

Octane Obit | Bridging the Platform with Government

Prepared by :
Summit Surds Ltd.
Octane Obit | Forecourt & Fuel Management System
Ruaka, Kiambu County, Kenya

Subject :
Government Engagement Strategy
Status: Draft for discussion
Date: 3 November 2026

1. How Can We Bridge Octane Obit with Government?

We have two potential avenues for engaging government, both presenting opportunities for market access, institutional collaboration and commercial growth.

Option A: Government as a Direct Customer

Position Octane Obit as a solution for government institutions, state corporations and public entities that operate fuel stations, manage fleets or oversee fuel storage facilities.

Potential applications include:

- Automated fuel dispensing and consumption monitoring.
- Centralised fuel inventory and tank monitoring.
- Fleet fuel management and transaction tracking.
- Automated reconciliation and financial reporting.
- Improved accountability and control over fuel expenditure.
- Real-time submission of sales data to KRA through eTIMS, enhancing tax compliance and supporting increased revenue collection.

This provides a more direct commercial entry point, allowing us to demonstrate the solution's value through specific institutional deployments.

Option B: Government as a Strategic Partner and Industry Enabler

Engage the Ministry of Energy and Petroleum and the Energy and Petroleum Regulatory Authority (EPRA) to introduce Octane Obit and explore how it can support broader petroleum sector objectives.

The focus would be on demonstrating how the platform can contribute to:

- Improved transparency (Through real time transmission as mentions above) and accountability in fuel retail operations.
- Better visibility of fuel transactions, stock levels and dispensing activities.
- Digital reporting and traceability across petroleum retail networks.
- Improved operational oversight and efficiency.
- Supporting the wider digitalisation of Kenya's petroleum sector.

This approach could create opportunities for institutional collaboration, pilot programmes and potentially broader industry adoption, subject to the relevant regulatory and policy frameworks.

> **Recommendation:** Pursue both approaches simultaneously. Option A offers a more direct route to commercial opportunities, while Option B creates an opportunity to establish Octane Obit within the wider petroleum industry's digitalisation agenda.

2. Which Ministry or Government Institutions Would We Need?

The following institutions would be relevant to our engagement strategy:

A. Ministry of Energy and Petroleum – State Department for Petroleum

This would be our primary policy-level engagement point. The department provides an opportunity to introduce Octane Obit within the context of petroleum sector development, digitalisation and operational efficiency.

B. Energy and Petroleum Regulatory Authority (EPRA)

EPRA would be a key technical and regulatory stakeholder. We should explore how Octane Obit could complement petroleum sector oversight, operational monitoring, reporting and accountability.

3. What Procedure Would We Follow?

We propose a structured, phased approach to government engagement.

Phase 1: Concept Development

Prepare a government-facing concept note introducing Octane Obit, its capabilities, the industry challenges it addresses and the value it can deliver.

The document should highlight:

- Forecourt and dispenser automation.
- Automatic tank gauging and inventory monitoring.
- Integrated payment solutions.
- Centralised forecourt management.
- Automated reconciliation and reporting.
- Multi-site monitoring and operational visibility.

Phase 2: Institutional Engagement

Seek introductory meetings with the State Department for Petroleum and EPRA to present Octane Obit, understand institutional priorities and identify possible areas of collaboration.

Phase 3: Technical Demonstration

Organise a structured demonstration showcasing the platform's capabilities, integrations and operational benefits.

Phase 4: Pilot Implementation

Explore the possibility of deploying Octane Obit at selected government-owned or participating facilities.

The pilot would allow us to demonstrate measurable improvements in fuel accountability, inventory visibility, dispensing accuracy, transaction reconciliation and operational efficiency.

Phase 5: Evaluation and Expansion

Use the pilot results to develop a broader implementation proposal and explore opportunities for expansion across other institutions or facilities.

Any government procurement or formal adoption would need to follow the applicable regulatory, procurement and institutional approval processes.

4. How Would We Want This to Work Better for Us as Industry Players?

Our objective should be to establish a mutually beneficial relationship that creates commercial opportunities while contributing to the modernisation of the petroleum industry.

I would recommend focusing on the following areas:

A. Industry Recognition and Credibility

Establish visibility and credibility for Octane Obit within the petroleum sector through engagement with relevant government institutions and industry stakeholders.

B. Market Access and Business Development

Create opportunities to engage government institutions, state corporations, Oil Marketing Companies (OMCs), independent fuel retailers and large fleet operators.

C. Technology Adoption

Position Octane Obit as a practical solution for improving fuel accountability, operational efficiency, transaction management and digitalisation of forecourt operations.

D. Pilot and Demonstration Opportunities

Secure opportunities to demonstrate Octane Obit in operational environments, generate measurable results and establish a credible implementation track record.

E. Strategic Partnerships

Develop relationships with relevant industry stakeholders, equipment suppliers, payment service providers and technology partners to strengthen the overall offering.

F. Scalable Commercial Opportunities

Develop a replicable commercial and deployment model that can support adoption across multiple stations, OMC networks and potentially other African markets.
